Introduction

In examining A. N. Whitehead's organic process cosmology in relation to Green Buddhism and Japanese shizengaku (nature-study), on overlapping topics including environmental ethics, ecology, sustainability, and philosophy of nature, Steve Odin in his paper “Whitehead's Eco-Philosophy of Nature & Japanese Shizengaku” opts for the view of nature as ranked into a hierarchy of degree of values, including aesthetic, moral, and spiritual values by Whitehead, Kenji Imanishi, and even some Japanese Buddhists as, it seems to me, authentically inclusive of the view espoused by most advocates of Deep Ecology and Green Buddhism emphasizing biospheric equality while rejecting all hierarchy. Inasmuch as Odin proposes to say that “...in addition to the horizontal axis of interconnectedness and biospheric equality, there is also a vertical axis establishing a hierarchy of compassion involving the expanded awareness of an ever-widening circle of relationships in nature,” I would like to use the expression “as authentically inclusive” in describing his stance of ecology vis-à-vis the view of nature in Deep Ecology and Green Buddhism throughout this response. Odin's inclusive view of nature is a Whiteheadian attempt at establishing a new vision of ecology while at the same time learning afresh from the Kyoto School of philosophy and sciences—this time from the Japanese shizengaku of Kenji Imanishi, which is influenced not only by the Japanese Zen philosophy of Kitaro Nishida, but also the modern environmental sciences.

Generally speaking, I would say that an inclusive language of philosophy or ecology must presuppose that which is included as having a power of its own to go deeper than the former. This is a paradox, in the sense that inclusion can only take place authentically insofar as that which is included is endowed with the power of preceding and undergirding it significantly: the inclusion in one's bosom of a meaningless and

---

1 This paper is my response to Professor Steve Odin's presentation “Whitehead's Eco-Philosophy of Nature and Japanese Shizengaku,” at the Eco-Sophia Symposium at Sophia University, February 20, 2010.
vacuous entity/experience/eco-system would be a disaster. It would not contribute anything great to the including subject while enriching and enhancing the latter’s world of experience. Therefore, inclusion is to be negated once by the power of presupposition/precedence in order to be authentically inclusive on its own. If the former did not presuppose the latter (which is a language of the deeper realm of being, at any rate), it would merely be adding something in a shallow, mechanistic manner to the latter which might also be a mechanistic description of the hidden reality of some kind.

A language of the deeper realm of being must be interconnected in some meaningful way or another to an inclusive language of philosophy or ecology. If it was actually done so, it would enable an inclusive language of philosophy or ecology to be authentically inclusive—and this in an interpretive fashion. In my opinion, an inclusive-interpretive language and a deeper-ontological language (i.e., a language for elucidating the deeper reality of being) can go paradoxically hand in hand. This state of affairs I might propose to call the inclusive/ontological paradox in philosophico-ecological language.

In what follows let me contextually articulate and utilize my thesis of inclusive/ontological paradox in philosophico-ecological language in order to adequately provide my comments on Steve Odin’s excellent paper.

To begin with, it may be in order that I pay attention to the general description of Odin’s enterprise just as is made clear by himself in these words:

I would argue that a deeply ecological worldview and environmental ethics requires an axiological cosmology which rejects the fallacy of vacuous actuality, whereby things are material substances devoid of life, experience and value, for a panpsychist view of living nature as a society of occasions of experience realizing some degree of intrinsic value as beauty or pervasive aesthetic quality. The main problematic taken up in this essay, is whether a deep ecology in both its Western and Green Buddhist variants requires an doctrine of biospheric egalitarianism, as argued by most deep ecologists, or whether it entails a hierarchy of intrinsic values, as held by Whiteheadians? The Whiteheadian position adopted here, is that while all events in the interconnected web of life have moral standing and biospheric equality as sentient occasions of experience that enjoy attainment of life, experience, and beauty. However, at the same time, they are developmentally organized into a hierarchy of degrees of values—including aesthetic, moral, cognitive, and spiritual
values.3

I think I can bring in here a passage on aims of education by Whitehead which makes sense of what Odin designates as the Whiteheadian position—one which he tries to articulate to the effect that “...while all events in the interconnected web of life have moral standing and biospheric equality as sentient occasions of experience that enjoy attainment of life, experience, and beauty; at the same time, they are developmentally organized into a hierarchy of degrees of values—including aesthetic, moral, cognitive, and spiritual values.”4 Whitehead writes:

Education must essentially be a setting in order of a ferment already stirring in the mind: you cannot educate mind in vacuo. In our conception of education we tend to confine it to the second stage of the cycle, namely, to the stage of precision. But we cannot so limit our task without misconceiving the whole problem. We are concerned alike with the ferment, with the acquirement of precision, and with the subsequent fruition.5

What Odin regards as the “biospheric equality”6 as found in sentient occasions of experience universally is assuredly implied pedagogically by Whitehead in his wording of “a ferment already stirring in the mind,” I believe. If the biospheric equality is

---

4 Ibid.
6 Cf.: “When the Creation is completed, God views the whole and sees that it is very good. Not only are individual species and their members of value in themselves individually, but the total creation with all its complex patterns of interdependence has a value that cannot be reduced to that of its individual members” (John B. Cobb, Jr., *Matters of Life and Death*, Luisville, KY: Westminster/John Knox Press, 1991, p. 25). John Cobb thinks that although deep ecologists do not have their views on the Bible, they could gain support from some of these features of the Genesis account. He knows that their approach is to argue that it is indeed the complex interrelated whole that is of supreme value. At any rate, I might say that what is important here is to regard this Whole-centeredness of deep ecologists as pointing to the ontological dimension of the ecosystems, which surpasses its axiological dimension. This judgment of mine is true even in relation to the Deity. I prize the following passage by Charles Hartshorne in this regard: “The infinite fullness of the divine life is empirical not metaphysical. Empirical science and theology (revealed theology is in this sense empirical)9 are the sources for any knowledge we have of God beyond the bare outline of the dimensions of his being. *That* he has an infinitude of contingent features is metaphysical: what these features are is not” (Charles Hartshorne, *Man’s Vision of God*, Hamden, CON: Archon Books, 1964, p. 345).
accepted as a universally prevenient ferment, it should be accepted on the ontological level in terms of what we earlier referred to as a deeper-ontological language. What then about the fact that all events in the interconnected web of life are “developmentally organized into a hierarchy of degrees of values”? Is it related to the stage of precision? I think so. And if so, I further think that the view that a deep ecology as espoused by both its Western and Green Buddhist variants requires an doctrine of biospheric egalitarianism, is not really precise philosophically. For whereas the biospheric equality is a rightful recognition on the ontological level of reality, as is typically manifest in the Buddhist enlightenment that “everything is empty,” a doctrine of biospheric egalitarianism is essentially ethical in nature. Accordingly, it needs to have an adequate precision in terms of an axiological cosmology which, as Whitehead claims, rejects the fallacy of vacuous actuality, whereby things are material substances devoid of life, experience and value. Hence, it has to be inclusive of the growth in life, experience and value as found in sentient creatures, both human and nonhuman; and the growth in this sense signifies a hierarchical evolution in cosmology.

I. Regarding Whitehead’s Eco-Philosophy of Nature: Is It Possible for the Temporal Irreversibility To Occur Without a Retreat to the Past?

Thus far, it has turned out that the encounter between a hierarchical view of ecology in Whitehead and some Buddhists and an egalitarian vision of nature in Deep Ecology and Green Buddhism is actually taking place on the plane of what Whitehead calls “precision” while presupposing, on the other hand, the dimension of “a ferment already stirring in the mind” that has something to do with the biospheric equality as it is meaningful ontologically. It would be precise for us to say within this context that a hierarchical view of ecology opposes and rejects an egalitarian-ethical vision of nature, while definitely tending to be inclusive of the biospheric-ontological equality. But how can we say so?

In order to answer this important question in ecology we have to find some precise way in which we can connect the biospheric-ontological equality to a hierarchical view of ecology properly. Can David Ray Griffin’s view of Whitehead’s radically different postmodern philosophy (on which Odin bases his understanding of Whitehead’s “Eco-Philosophy of Nature”) provide one?

Basically, my answer to this question is in the affirmative—but on the condition that proponents of a hierarchical deep ecology as opposed to a “deep ecology-e or egalitarian deep ecology,” such as Odin and Griffin, can explicate how their option for the temporal irreversibility is philosophically compatible with their acceptance of what
Griffin calls “deep ecology-na or non-anthropocentric environmental philosophy” as well as of “deep ecology-b or biocentric deep ecology”

It seems to me that Odin is certainly well aware of the issue I am presenting here, as is clearly shown in the following passage:

Although Whitehead’s ecological vision of nature recognizes intrinsic value of each occasion of experience by virtue of its attainment of aesthetic value quality for itself, for others and for the whole community of living nature, as well as for the dipolar God-in-process, it also recognizes a hierarchy of values arising in the developmental aspect of nature as a process of creative, emergent and holistic evolution striving to attain greater wholeness as well as autonomous self-creativity through occasions which include yet transcend lower occasions of experience. Whitehead thus sets forth a doctrine underscoring the irreversibility, or asymmetry, of the temporal evolutionary process as a creative advance into novelty, wherein the higher developmental stages include yet transcend the lower stages, but not vice versa.7

Yet, it also seems to me that Odin’s portrayal of Whitehead’s view of the irreversibility, or asymmetry, of the temporal evolutionary process as a creative advance into novelty can be challenged by a question such as is raised by Kitaro Nishida regarding Bergson’s parallel idea of creative evolution. Nishida writes:

Though pure duration is unrepeatable, in creative evolution the entire past acts as present, and the more we attain the deep foundation of the self, attaining a state of pure creative evolution, the more we are able to transform the past into the present. Bergson compares memory to a cone, with the past as its apex. Developing this image, we can say that the farther back we go toward the broad base of the cone, and the more concentratedly we assume the movement from base to apex, the more the entire past becomes the present, so that the present becomes the center of gravity of the totality.8

As is well known, Nishida’s philosophy of pure experience was basically schematized by these words appearing in the Preface of his maiden work An Inquiry into the Good: “For many years I wanted to explain all things on the basis of pure

7 “WENJS,” 3.
experience as the sole reality.”

The scheme of thought herein involved is of threefold
development: it begins with “pure experience” (which might be considered in parallel
with Whitehead’s phase of “ferment” in his pedagogy) which is then reflected upon by
way of the stage of “Onlooks” (as manifested by his wording of “on the basis of [my
looking upon] pure experience as the sole reality”) which is further connected to the
stage of “explaining all things” (which might be correlative to Whitehead’s third realm
of “generalization” coming up in education after “romance/ferment” and “precision”).

Now, what appears in the afore-cited second volume of Nishida is a new thought
culminating in the following dictum: “When absolute free will turns and views itself, or,
in Boehme’s terms, when the objectless will looks back on itself, the infinite creative
development of this world is set up. That is why history is the first, immediate object
of cognition. How is this reflective moment of absolute will possible? Absolute will, as
both ‘creating and uncreated’ and ‘neither created nor creating,’ includes the possibility
of retreating (Lat., regressus) as well as advancing (egressus).”

What appeared in the first volume in terms of “pure experience” is now taking shape as the twofold
possibility of retreating and advancing; and the function of Onlooks is to mediate
between retreating (regressus) and advancing (egressus).

When viewed from this point of view delivered by Nishida, Odin’s reference to
Whitehead’s idea of the temporal irreversibility is too simplistic, it seems to me. Odin
goes hand in hand with Griffin’s grasp of Whitehead’s worldview as deeply ecological in
that his position supports deep ecology in the first two senses: deep ecology-b (i.e.,
biocentric deep ecology) as well as deep ecology-na (i.e., non-anthropocentric deep
ecology). And he rejects, with Griffin, deep ecology-e or egalitarian deep ecology.

I understand that if deep ecology was biocentric and non-anthropocentric, as
professed by Odin and Griffin, it would mean that humans are preceded by the
biosphere as a whole. If so, we have to acknowledge our natural/earthy dependence on
the biosphere—even through our confessions of sins of overlooking and damaging it by
our modern industrial, petroleum-consuming, civilization over the past five centuries.
Within this specific context, Whitehead’s idea of education as that which must
essentially be a “setting in order of a ferment already stirring in the mind” is
interchangeable with the role and responsibility of civilization as a whole vis-à-vis the

12 Ibid.
biosphere, isn’t it?

We have to go back to the past acts in our civilization of ruining the biosphere reflectively: the Cenozoic Era is terminated. Then, it seems to me that Nisida’s following words are really to the point at the present moment: “The present is both the apex of creative evolution and the point from which we look back to the past in reflection; it is the point of fusion between the will’s advance to the future and reflection’s return to the past. But here we are contradicted by the fact, insisted on by Bergson, that we cannot return to the past of even one moment earlier. How can we square reflection with the unrepeatability of the past? ...Only in that which is morally dead is the past entirely fixed. We can take this to mean that in teleological causality the past is a means to the present and the future, and its meaning changes in accord with the path on which it advances to the future (whereas mechanical causality supposes an immovable past). Thus the meaning of Augustine’s previous life was changed by his conversion.”13 By the same token, we can change the ruins of our civilization by initiating, with Thomas Berry, a new era—the Ecozoic, which I believe is the conversion of the 21st century.

With all these critical words of mine, nonetheless I heartily affirm Odin’s and Griffin’s explication of the difference between “compound individuals” like humans and “aggregational organizations” having no experience or spontaneity, such as sticks, stones and mountains.14 I especially like to see Griffin mentioning the following dictum: “Animal liberationists and humanitarians ... focus primarily upon intrinsic value and therefore primarily upon individuals. Given this focus, animal liberationists rightly see that, among the nonhuman forms of the higher animals, especially mammals, have the greatest capacity for intrinsic value, and thereby the greatest capacity to suffer and to have their potentials for self-realization thwarted.”15 In my case, what is most crucial is the principle that retreating (regressus) is advancing (egressus), which, in my perception, is shot through with the ontological/inclusive paradox.

II. Regarding Hierarchy of Nature in Whitehead & Green Buddhism: A Proposal for a Hierarchy of the Stages of the Subjectivist Principle

Given my aforementioned critical articulation of Nishida’s idea of the regressus/egressus or retreating/advancing principle of philosophy against the background of Odin/Griffin thesis of the hierarchical deep ecology, it is now well

13 IRS, 129.

15 WRDPP, 84; cited in “WENJS,” 5.
conceivable to me why it is proper for Odin to consider Alan Sponberg’s vision of “the hierarchy of compassion” in tandem with Whitehead’s doctrine of prehension dealing with causal efficacy, concern, and sympathy. For what is important now is the business of making sense of the third stage of philosophico-ecological inquiry into nature, “general explanation” of the universe in which we find ourselves, namely, metaphysics proper, including metaphysical moral theory.

In this context, it is really enjoyable to read Sponberg’s idea of the vertical axis of a developmental hierarchy of compassion and Odin’s consideration of Whitehead’s organismic process cosmology together. Let me quote two passages, one from Sponberg’s essay “Green Buddhism and the Hierarchy of Compassion,” the other from Odin’s essay under consideration:

This is a model of what I would call a “hierarchy of compassion.” As one ascends the vertical, developmental axis ... the circle of one’s interrelatedness increases ... In the hierarchy of compassion, vertical progress is a matter of reaching out, actively and consciously, to affirm an ever widening circle of expressed interrelatedness.16

Likewise, compassion, concern, or sympathy is a cornerstone of Whitehead’s organismic process cosmology. According to Whitehead, perception in the primordial mode of causal efficacy involves prehension or feeling of feeling, otherwise understood as an act of sympathetic concernedness. Whitehead asserts that the object-into-subject pattern of causal transmission is the “concern” structure of immediate experience: “The occasion as subject has a ‘concern’ for the object. And the ‘concern’ at once places the object as a component in the experience of the subject” (AI 176). Whitehead continues, “Concernedness is of the essence of perception” (AI 180). This moral sense of causal perception whereby living organisms have a vague awareness of social relations to the surrounding environment is called perception in primordial mode of causal efficacy in terms of “sympathy” or feeling of feeling (PR 162).17

Here either of them, Sponberg and Odin, has come up with an elevation of consciousness beyond a mere egalitarianism in ecology, Buddhistically or in terms of

---

17 “WENJS,” 7.
Whitehead’s Eco-Philosophy of nature, to see all things as interconnected universally. But we have to know that this mode of elevated consciousness, namely, “compassion,” has just resulted from a new way of philosophical precision in which we look upon the interconnectedness lying at the bottom of all things “as” ultimately or ontologically real. From my viewpoint of the ontological/inclusive paradox, I prize the following conclusive remarks by Odin: “It can be concluded that for Whitehead, as for Green Buddhism, moral compassion or sympathy is not merely an abstract ethical principle, but requires a shift in perception that directly sees [as pivotal] the interconnectedness of events in nature, whereby an occasion has value for itself, others and the whole.”

I inserted two words here: as pivotal. The reason is this, that the ontological “subjectivist principle” whereby “I see the interconnectedness of all things as potentially lying at their bottom” is transfigured and lifted into the actual-ethical inclusive “subjectivist principle” whereby “I see all things as interconnected universally in our actual world.” Interconnectedness-o or ontological interconnectedness in deep ecology has to be creatively transformed into interconnectedness-i or inclusive interconnectedness which is at the core of what is designated as “the hierarchy of compassion.” Here “I” am pivotal in elevating my consciousness, constituting the reformed subjectivist principle, from the bottom of all things into the hierarchy of compassion. There are some different stages of the subjectivist principle: romance, precision, and generalization. And the subjectivist principle performs the game of Onlooks differently in accordance with the different stages.

III. Regarding the Japanese Shizengaku of Kinji Imanishi: A Process of Organism-Environment Interaction Reconsidered as “Kyodo” (共働) Rather Than “Kyosei” (共生)

Odin’s essay is uniquely intercultural in that he pays due attention to Japanese Shizengaku (nature-study) as developed by Kinji Imanishi in his pioneering work Seibutsu no sekai (The World of Living Things, 1941), now translated into English as A Japanese View of Nature: The World of Living Things (2002). Odin thinks that there are so many parallels between Imanishi’s Shizengaku and Whitehead’s organismic

---

18 “WENJS,” 8.

19 Here I am utilizing in a different context (namely, ecology) Whitehead’s reference to the reformed subjectivist principle in terms of an important phrase: “my perception of this stone as gray.” If one failed to speak of “my perception,” while accounting for the proposition that “this stone is gray,” one would be doomed to fall into a subject-predicate metaphysics, like Hume’s. See Alfred North Whitehead, Process and Reality, Corrected Edition, eds. David Ray Griffin and Donald W. Sherburne (New York: The Free Press, 1978), p. 159; elsewhere cited as PR.
process vision of living nature that a much longer treatment is needed to do the topic full justice. Their common denial of the scientific materialist view of nature as constituted by lifeless substances, in Odin's view, results from an organismic process model of living nature, grounded in both scientific method as well as immediate experience through radical empiricism.20

Odin notices that Imanishi was especially influenced by Nishida's chapter on “Nature” from An Inquiry into the Good (Jpn., Zen no kenkyu, 1911), which analyzes the continuum of living nature with a Zen-like interpretation of William James' radically empirical notion of “pure experience” (Jpn., junsui keiken) devoid of subject-object dualism (Imanishi: 2002, xxxvi).21 If I am correct, here Odin is paying due attention to the “non-dualistic grasp of pure experience” as perceived by Imanishi in accordance with Nishida’s philosophy of pure experience. However, as a scientific biologist, Imanishi's orientation was more clearly geared toward elucidating how the organism as subject (turning to be object) and the environment as object (turning to be subject) are “interactively interrelated.”22 Hence, the following passage by Odin is really to the point and beautiful.

Imanishi, like Whitehead's philosophy of organism, views nature as a society or community of socially related creative organisms interacting with their environments, so that each part is related to the whole biosphere of the natural continuum (2002, xlii). According to Whitehead, nature does not consist of independent, atomic, and lifeless substances. Likewise, for Imanishi, nature is a “society of living organisms” (2002, 61). Thus, both Imanishi and Whitehead develop variants of an organismic process model of living nature as a dynamic relational continuum wherein each living event is a field arising through a process of organism-environment interaction that both contains and pervades the whole ecosystem, such that each part contains the whole and the whole is manifest in each part.24

Odin also mentions further parallels between Imanishi and Whitehead such as the

---

20 “WENJS,” 10.
21 Ibid.
22 It seems to me that this non-dualistic grasp of pure experience might be in continuity with today's general sociological shift toward the symbiotic union (Jpn., Kyosei: 共生) in Japan. However, this is a kind of metabasis of ontology into the area of sociology.
23 I propose to call this state of affairs in Japanese: Kyodo: 共働.
“recognition” (or intuitive grasping of relationships in nature) and “prehension” (or sympathy or causal feeling of relationships to the environment), “a ranked society” (2002, 70) and “a hierarchy of societies” (PR, 96-109), and “integrity” and “creativity.” 25

Concluding Remarks: Toward an Ecological Civilization of Co-Creation (Kyoso: 共創)

However, it seems to me that the greatest parallel would be the one between Imanishi’s thesis to the effect that a “peaceful existence” as equilibrium within the whole biosphere of nature is the goal of all living organisms in their adjustment to their social environments (2002, 24) and Whitehead’s chapter on Peace at the conclusion of Adventures of Ideas.

What is involved in the concept of Peace is, if I am correct, self-transcendence by us humans in conformity with the Divine self-forgetfulness in Adventure. Whitehead writes:

[1]This feeling requires for its understanding that we supplement the notion of the Eros [i.e., the Primordial Nature of God] by including it in the concept of an Adventure in the Universe as One [i.e., the Consequent Nature of God as containing the Universe advancing adventurously]. This Adventure embraces all particular occasions but as an actual fact stand beyond any one of them.26
[2] It is the immanence of the Great Fact including this initial Eros and this final Beauty which constitutes the zest of self-forgetful transcendence belonging to Civilization [i.e., the divine-human co-creation] at it height.27
[3] The Adventure of the Universe starts with the dream and reaps tragic Beauty. This is the secret of the union of Zest with Peace: —That the suffering attains its end in a Harmony of Harmonies. The immediate experience of this Final Fact, with its union of Youth and Tragedy, is the sense of Peace.28

I believe these three passages can thoroughly be understood only by reference to Whitehead’s final words spoken before Lucien Price on September 11, 1947: “In so far as man partakes of this creative process does he partake of the divine, of God, and that participation is his immortality, reducing the question of whether his individuality survives death of the body to the estate of an irrelevancy. His true destiny as

27 AI, 295-296.
28 AI, 296.
co-creator in the universe is his dignity and his grandeur."

In the midst of our co-creation with the divine-in-process does Peace lie as a Harmony of Harmonies. This level of a deep divine-human co-creative ecology is to be called in Japanese: Kyoso—共創, I believe. Whitehead passed away December 30, 1947 in Peace.
